

Burndown Chart - Sprint 2

- This burndown chart represents our progress throughout sprint 2.
- The progress and velocity are generally steady, with some progress made at the beginning of the sprint, as we resolve outstanding issues from sprint 1 such as the login issues pertaining to Google and GitHub logins.
- Velocity slows towards the end of the first week but accelerates towards the end of the second, as the work we had done on our sprint 2 goals are completed. These include completing quote-pulling from the Ninja API and integrating of ChatGPT to the frontend. On top of this, several aesthetic features have also been implemented, such as the floating animation on the quotes, applying and saving user preferences, and changeable backgrounds.
- By the end, some minor features, such as transition animations when quotes are cycled remain outstanding.
